# Quiescent Cosmology

The Conformal  
Structure of the  
FRW Space-times

Philip Threlfall  
Supervisor: Susan  
Scott

Proposed by John Barrow in 1978 to explain large scale isotropy in the universe.

Quiescent Cosmology  $\implies$  the early universe was highly ordered.

*The universe is isotropic on a large scale because we are at a sufficiently early stage in its evolution.*

Opposite view as compared to Chaotic Cosmology

Conclusions

The Friedmann-Robertson-Walker (FRW) solution to the Einstein field equations describes space-times that

- ▶ are spherically symmetric,
- ▶ homogeneous,
- ▶ isotropic and
- ▶ are able to expand and/or contract.

# The FRW Space-times

The FRW metric is given by

$$ds^2 = -dt^2 + a^2(t)d\sigma^2 \quad (2)$$

where

$$d\sigma^2 = \frac{dr^2}{1 - kr^2} + r^2 d\theta^2 + r^2 \sin^2 \theta d\phi^2 \quad (3)$$

and  $a(t)$  is known as the scale factor.

Scale factor  $\implies$  radius of curvature

Conclusions

A FRW space-time is said to admit a Big Bang/Crunch type singularity if the scale factor goes to zero as  $t \rightarrow t_0^\pm$ .

It will be a Big Bang if we approach  $t_0$  from above and a Big Crunch if we approach  $t_0$  from below.

# Conclusions and Further Work

We have new structures for the singularities in the FRW space-times in terms of conformal definitions.

It is easy to examine the behaviour of a conformally related space-time because it depends only on the conformal factor  $\Omega$ .

## Definition (Isotropic Past Singularity (IPS)<sup>3</sup>)

A space-time,  $(\mathcal{M}, \mathbf{g})$  admits an isotropic past singularity if there exists a space-time  $(\tilde{\mathcal{M}}, \tilde{\mathbf{g}})$ , a smooth cosmic time function  $T$  defined on  $\tilde{\mathcal{M}}$  and a conformal factor  $\tilde{\Omega}(T)$  which satisfy

1.  $\mathcal{M}$  is the open neighbourhood  $T > 0$ ,
2.  $\mathbf{g} = \tilde{\Omega}^2(T)\tilde{\mathbf{g}}$  on  $\mathcal{M}$ , with  $\tilde{\mathbf{g}}$  regular (at least  $C^3$  and non-degenerate) on an open neighbourhood of  $T = 0$ ,
3.  $\Omega(0) = 0$  and  $\exists b > 0$  such that  $\Omega \in C^0[0, b] \cap C^3(0, b]$  and  $\Omega(0, b] > 0$ ,
4.  $\lambda \equiv \lim_{T \rightarrow 0^+} L(T)$  exists,  $\lambda \neq 1$ , where  $L \equiv \frac{\Omega''}{\Omega} \left(\frac{\Omega}{\Omega'}\right)^2$  and a prime denoted differentiation with respect to  $T$ .

<sup>3</sup>Scott, 1998

It turns out that to have true initial isotropy we must also constrain the fluid flow, as follows

### Definition (Fluid Congruence of an IPS)

With any unit time-like congruence  $\mathbf{u}$  in  $\mathcal{M}$  we can associate a unit time-like congruence  $\tilde{\mathbf{u}}$  in  $\tilde{\mathcal{M}}$  such that

$$\tilde{\mathbf{u}} = \Omega \mathbf{u} \quad \text{in } \mathcal{M}. \quad (10)$$

- ▶ If we can choose  $\tilde{\mathbf{u}}$  to be regular (at least  $C^3$ ) on an open neighbourhood of  $T = 0$  in  $\mathcal{M}$ , we can say that  $\mathbf{u}$  is regular at the IPS.
- ▶ If, in addition,  $\tilde{\mathbf{u}}$  is orthogonal to  $T = 0$ , we say that  $\mathbf{u}$  is orthogonal to the IPS.

## Definition (Isotropic Future Singularity (IFS))

A space-time,  $(\mathcal{M}, \mathbf{g})$  admits an isotropic future singularity if there exists a space-time  $(\bar{\mathcal{M}}, \bar{\mathbf{g}})$ , a smooth cosmic time function  $T$  defined on  $\bar{\mathcal{M}}$  and a conformal factor  $\Omega(T)$  which satisfy

1.  $\mathcal{M}$  is the open neighbourhood  $T < 0$ ,
2.  $\mathbf{g} = \Omega^2(T)\bar{\mathbf{g}}$  on  $\mathcal{M}$ , with  $\bar{\mathbf{g}}$  regular (at least  $C^2$  and non-degenerate) on an open neighbourhood of  $T = 0$ ,
3.  $\Omega(0) = 0$  and  $\exists c > 0$  such that  $\Omega \in C^0[-c, 0] \cap C^2[-c, 0)$  and  $\Omega$  is positive on  $[-c, 0)$ ,
4.  $\bar{\lambda} \equiv \lim_{T \rightarrow 0^+} \bar{L}(T)$  exists,  $\bar{\lambda} \neq 1$ , where  $\bar{L} \equiv \frac{\Omega''}{\Omega} \left(\frac{\Omega}{\Omega'}\right)^2$  and a prime denoted differentiation with respect to  $T$ .

## Definition (Fluid Congruence of an IFS)

With any unit time-like congruence  $\mathbf{u}$  in  $\mathcal{M}$  we can associate a unit time-like congruence  $\bar{\mathbf{u}}$  in  $\bar{\mathcal{M}}$  such that

$$\bar{\mathbf{u}} = \Omega \mathbf{u} \quad \text{in } \mathcal{M}. \quad (11)$$

- ▶ If we can choose  $\bar{\mathbf{u}}$  to be regular (at least  $C^2$ ) on an open neighbourhood of  $T = 0$  in  $\mathcal{M}$ , we can say that  $\mathbf{u}$  is regular at the IFS.
- ▶ If, in addition,  $\bar{\mathbf{u}}$  is orthogonal to  $T = 0$ , we say that  $\mathbf{u}$  is orthogonal to the IFS.

## Definition (Future Isotropic Universe (FIU))

A space-time,  $(\mathcal{M}, \mathbf{g})$  admits an future isotropic universe if there exists a space-time  $(\bar{\mathcal{M}}, \bar{\mathbf{g}})$ , a smooth cosmic time function  $T$  defined on  $\bar{\mathcal{M}}$  and a conformal factor  $\Omega(T)$  which satisfy

1.  $\lim_{T \rightarrow 0^-} \Omega(T) = +\infty$  and  $\exists c > 0$  such that  $\Omega \in C^2[-c, 0) \cap C^2[-c, 0)$  and  $\Omega$  is strictly monotonically increasing and positive on  $[-c, 0)$ ,
2.  $\bar{\lambda}$  as defined above exists,  $\bar{\lambda} \neq 1, 2$ , and  $\bar{L}$  is continuous on  $[-c, 0)$  and
3. otherwise the conditions of the previous definitions are satisfied.
